

In the modern society, it's no exaggeration to say that technology is an enormous part of our lives. We use computers to store and compute almost all the data and believe that they can bring us a better world. Moreover, since COVID-19 appeared, the online education had been adopted to prevent the students from infected. However, this policy also led to the argument whether technology should be used in our education system. In order to see the answer, we should first discuss the pros and cons which technology can give to us.

To begin with, one of the advantages is, of course, it solved the problem that students would have to take the risk of getting the disease under the pandemic. By taking online classes, students could never get infected through their screen. Even though we tend to take classes in real life, technology can still benefit us as well. For example, by presenting the online videos, teachers are able to lead more students to understand the content in the textbooks. In addition, showing the real situations through the Internet, which is one of the most convenient approaches, can be more effective to teach the students the usage of the knowledge. Futhermore, it's totally imposible for most people not to use the modern technology in

their lives, teachers should not merely take the benefits but also teach their students the correct methods of using technology, in case they become unfamiliar with the technology or use it in the wrong ways.

In contrast, technology can also bring people disadvantages. The most apparent one is the addiction to the Internet and social media. Far before the pandemic started, several researches had indicated that children addicted to the Internet could hardly focus on their work, especially the schoolwork. In this case, lots of students scroll the smartphones most of the time on social media and online games, and thus decrease their effectiveness in learning at school. This phenomenon implied that if we adopt the use of the technology like smartphones or notebooks in the classroom, a few students may secretly surf the Internet for playing online games and seeing the social media and, consequently, they can't pay attention to the lecture and even waste their time.

Nevertheless, we can't just forbid the use of technology in education simply because of the addiction. Instead, we should tell the children that it's incorrect to spent all the time on playing or relaxing. Only if we take such action will these people stop the

addiction in the future. Moreover, people should teach these students to be careful to the potential risk on the Internet lest they share their private data to strangers and suffer from them.

All in all, modern technology not only brings us a more convenient world but also brings plenty of advantages into our education system. Yet, it also causes disadvantages to the students. However, were it not for technology can we have such wonderful world. As a result, it's essential that we do all the prevention from its damage to society, since the contemporary children will grow up in the future and keep the benefits of the newestly developed technology.
